[NOTE](#)

Fix modal overflow on small screens

[NOTE](#)

Add missing keyboard shortcuts to Help page

[NOTE](#)

API

Add rate limiting headers to public API

[NOTE](#)

Fix JSON serialization issue with null values

[NOTE](#)

Add batch export API endpoint

[NOTE](#)

Release Notes

Descriptions of any specially notable changes or additions since the previous release.

Breaking Changes

API

The API now includes standard `X-RateLimit-*` headers in all responses to better inform consumers of usage thresholds.

NOTE: The default rate limit remains unchanged.

Features

API

A new batch export endpoint is now available at `/api/export/batch`. Supported formats:

- CSV (default)
- JSON with optional compression

Example usage:

```
curl -X POST /api/export/batch \  
  -H "Content-Type: application/json" \  
  -d '{"format": "csv", "ids": [1,2,3]}'
```

Bug Fixes

Web UI

Modals now scroll correctly on devices with < 600px screen width.

API

Previously, null values were omitted from JSON payloads. This has been corrected.

WARNING: Impact: Clients expecting explicit nulls will now receive them as specified.

Improvements

Web UI

Introduces an interactive editor directly in the dashboard, allowing users to modify widgets without navigating away.

This significantly streamlines common tasks.

The Help page now includes a full list of supported keyboard shortcuts, including:

- `/` to focus search
- `?` to show help modal
