

1.2.0 Release - May 29, 2026

Complete Changelog

Comprehensive list of all changes in 1.2.0, organized by component and change type.

Each entry includes links to the original issue and commit for detailed information.

- Introduce plugin system for extensibility
[NOTE](#)
- Added mobile application supported
[NOTE](#)
- Implemented advanced analytics dashboard
[NOTE](#)
- Removed deprecated basic authentication
[NOTE](#)
- Enhanced AI suggestions with context awareness
[NOTE](#)
- Redesign user interface with modern design system
[NOTE](#)

Release Notes & Highlights

Detailed information about the most important changes in 1.2.0.

This section focuses on changes that directly impact users and require attention during upgrades.

Introduced a powerful plugin system that allows developers to create custom extensions. Features include:

- Plugin marketplace integration
- Sandboxed execution environment
- Rich API for plugin development
- Hot-loading of plugins without restart

This opens up endless possibilities for customization and third-party integrations.

Launched native mobile applications for iOS and Android! The mobile apps provide:

- Full feature parity with web application
- Offline mode with automatic sync

- Push notifications for important updates
- Optimized touch interface
- Biometric authentication support

Download from the App Store or Google Play Store.

Introduced an advanced analytics dashboard providing deep insights into:

- User engagement patterns
- Content performance metrics
- System usage statistics
- Custom report generation
- Data export capabilities
- Real-time monitoring

Perfect for administrators and teams wanting to optimize their workflows.

Breaking Change: Removed basic authentication support as previously announced. All API access now requires OAuth2 authentication.

If you haven't migrated yet:

1. Set up OAuth2 application credentials
2. Update your API clients to use OAuth2 flow
3. Test your integration before upgrading

See our migration guide for detailed instructions.

Significantly enhanced AI-powered suggestions with context awareness. The AI now:

- Considers document structure and content
- Learns from user preferences and patterns
- Provides more relevant and accurate suggestions
- Adapts to different content types

This feature has graduated from experimental status and is now fully supported.

Unveiled a completely redesigned user interface built on our new design system:

- Modern, clean aesthetic
- Improved accessibility (WCAG 2.1 AA compliant)
- Better responsive design for all screen sizes
- Consistent component library
- Enhanced dark mode support

- Customizable themes

The new design improves usability while maintaining familiar workflows.
